A1: The 2.4 GHz band offers better range but suffers from more interference due to its use by other devices like microwaves and Bluetooth. The 5 GHz band offers faster speeds and less congestion but has a shorter range. Choosing the optimal band depends on the specific needs and environment of your network.

Q2: How do I perform a wireless site survey?

A2: A wireless site survey involves using specialized tools (either dedicated hardware or software) to measure signal strength, identify interference sources, and determine optimal access point placement. The goal is to ensure consistent and reliable coverage throughout your wireless network's coverage area.

Q3: How can I improve wireless roaming performance?

A3: Improving wireless roaming involves configuring your access points for proper overlap and using features like 802.11r/k (fast roaming) to minimize latency during handoffs between access points. Proper channel planning and antenna placement also play a significant role.

Q4: What are the best security practices for a wireless LAN?

A4: Implement strong WPA3 encryption, use long and complex passwords, regularly update firmware, enable MAC address filtering (if necessary), and utilize a firewall. Regularly scan for rogue access points and other security threats.

Q5: How can I troubleshoot slow Wi-Fi speeds?

A5: Troubleshooting slow Wi-Fi involves identifying potential bottlenecks. Check for interference, optimize channel selection, ensure proper access point placement, update firmware, and check for network congestion. Consider using a wireless analyzer to diagnose issues more precisely.

Q6: What is a wireless mesh network?

A6: A wireless mesh network uses multiple access points to extend Wi-Fi coverage across a larger area. These access points communicate with each other, creating a self-healing and redundant network that is more resilient to failures.

Q7: What is the importance of Quality of Service (QoS)?

A7: QoS allows you to prioritize certain types of network traffic over others. This ensures that critical applications (like video conferencing or VoIP) receive sufficient bandwidth even during periods of high network congestion.
